## A quick review: Challenges

- Find the best global alignment of two sequences
- Find the best global alignment of multiple sequences
- Find the best local (partial) alignment of two sequences
- Find the best match (alignment) of a given sequence in a longer dataset of sequences

# A quick review: Global Alignment 

## Global Alignment Mission:

Find the best global alignment between two sequences.
e.g., Find the best alignment of GAATC and CATAC:

$$
\begin{aligned}
& -\mathrm{GAAT}-\mathrm{C} \\
& \mathrm{C}-\mathrm{A}-\mathrm{TAC}
\end{aligned}
$$

>"Correct" alignment vs. "best" alignment

## The Needleman-Wunsch Algorithm

- An algorithm for global alignment on two sequences
- A Dynamic Programming (DP) approach
- Yes, it's a weird name.
- DP is closely related to recursion and to mathematical induction
- We can prove that the resulting score is optimal.

- When a program returns a single sequence alignment, it may not be the only best alignment but it is guaranteed to be one of them.
- In our example, all of the alignments at the left have equal scores.

## DP in equation form

- Align sequence $x$ and $y$.
- $F$ is the DP matrix; $s$ is the substitution matrix; $d$ is the linear gap penalty.
$F(0,0)=0$

$$
F(i, j)=\max \left\{\begin{array}{l}
F(i-1, j-1)+s\left(x_{i}, y_{j}\right) \\
F(i-1, j)+d \\
F(i, j-1)+d
\end{array}\right.
